Answer all the Questions

PART-A

(8 x 2=16)

- | | | | | |
|----|--|--|-----|----|
| 1. | Give types of stub axle. | | CO4 | K2 |
| 2. | Name the classification of braking system. | | CO4 | K2 |
| 3. | What is included angle? | | CO4 | K2 |
| 4. | Name any four types of suspension spring. | | CO4 | K2 |
| 5. | Write short notes on "LPG". | | CO5 | K1 |
| 6. | Differentiate between bio-fuel and bio-diesel. | | CO5 | K4 |
| 7. | Why alcohol is an alternate fuel for S.I engine? | | CO5 | K2 |
| 8. | What do you understand by the term hybrid vehicle? | | CO5 | K2 |

PART-B

(3 x 13=39)

- | | | | | | |
|-----------|--|--|------|-----|----|
| 9. | (a) (i) What are the functions of steering system? | | (3) | CO4 | K2 |
| | (ii) Discuss in detail working method of steering linkage system with suitable sketches. | | (10) | | K1 |
| OR | | | | | |
| 9. | (b) (i) Write the various steering geometry. | | (3) | CO4 | K1 |
| | (ii) Explain any one of the front independent suspension system with neat diagram? | | (10) | | K2 |
| 10. | (a) With relevant block diagrams, analyze the working of 4 channel 4 sensor type ABS system used in passenger cars. | | (13) | CO4 | K4 |
| OR | | | | | |
| 10. | (b) (i) What are the requirements of good breaking system? | | (6) | CO4 | K2 |
| | (ii) Draw the schematic diagram of pneumatic breaking system and explain it. | | (7) | | K1 |
| 11. | (a) Describe the construction and working of hybrid vehicle with neat sketch? | | (13) | CO5 | K1 |
| OR | | | | | |
| 11. | (b) Develop and explain the engine modifications to be undertaken in the S.I engine for Alcohols or Ethanol as alternative fuel? | | (13) | CO5 | K3 |

PART-C

(1 x 15=15)

- | | | | | | |
|-----------|--|--|-----|-----|----|
| 2. | (a) (i) What are the merits and demerits of LPG as a motor vehicle fuel? | | (8) | CO5 | K2 |
| | (ii) Write the advantages of LNG? | | (7) | | K1 |
| OR | | | | | |
| 12. | (b) (i) Explain the construction and working of the PEM fuel cell with sketch. | | (8) | CO5 | K2 |
| | (ii) Explain any one method of hydrogen production. | | (7) | | |

CO4	Discuss the terminology, working of steering, braking and suspension systems.
CO5	Explain the different alternative energy resources used in automobile industry.

K1: Remembering K2: Understanding K3: Applying K4: Analyzing K5: Evaluating K6: Creating

% of Remembering	% of Understanding	% of Application and higher order Abilities (K3+K4+K5+K6)	Total
33.87	43.55	22.58	100%

PART-A

- types of stub axle. (2)
- reversed Elliot, Lamoine and Reversed Lamoine (2)
- the classification of braking system. (2)
- braking system in Automobile;
- applications – Foot, Hand brake
- Method of power – Mechanical, Hydraulic, Vacuum, Electrical and Air brake.
- method of operations – Manual, Servo and Power operation brake.
- construction – Drum type and Disc type brake.
- included angle? (2)
- ded Angle is calculated by adding the SAI and Camber Angle together. (2)
- any four types of suspension spring. (2)
- ng, Helical Spring or Coil Spring, Torsion Bar, Rubber Springs (2)
- short notes on "LPG". (2)
- petroleum gas or liquid petroleum gas (LPG or LP gas), also referred to as simply propane or is a flammable mixture of hydrocarbon gases used as a fuel in heating appliances, cooking (2)
- it, and vehicles.
- entiate between bio-fuel and bio-diesel. (2)
- iesel is made from vegetable oils (palm oil, soybean oil) and animal fat. Biofuels are made from (2)
- nts other than petroleum derived products such as human and animal wastes, etc.
- el is non-toxic and biodegradable, but some of the biofuels contain toxic gases.
- alcohol is an alternate fuel for S.I engine? (2)
- also having a good calorific value, a good volatility, not much higher ignition energy, average auto (2)
- temperature, it's viscosity also not much higher, easy burning, easy availability, easy storing.
- do you understand by the term hybrid vehicle? (2)
- ybrid electric vehicles (HEVs) combine the internal combustion engine (ICE) of a conventional (2)
- with the battery and electric motor of an electric vehicle.

PART-B

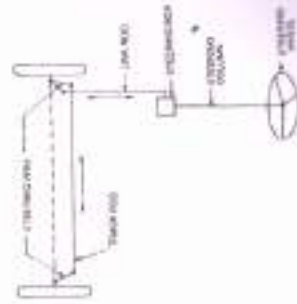

- 9.a) (i) What are the functions of steering system? (5)
- It helps in swinging the wheels to the left or right.
 - It helps in turning the vehicle at the will of the driver.
 - It provides directional stability.
 - It helps in achieving self-centering efforts.
 - It absorbs major part of the road shocks.
- 9.a) (ii) Discuss in detail working method of steering linkage system with suitable sketches. (10)
- A steering system is designed to enable the driver to control the travelled path of a vehicle

- 1. Steering - box :-**
The steering-box provides a gear reduction so that only a small effort, a much larger force can be applied to the steering linkage.
- 2. Drop-arm:-**
This forged lever-arm is bolted on to a tapered steering-box output (rocket-shaft). It is usually positioned so that it hangs or drops down wards. Its swing actum imparts a circular-arc movement to the drag-link
- 3. Drag-link:-**
This tubular rod converts the circular movement of the drop-arm into a linear push or pull motion of the drag-link arm which is rigidly attached to one of the stub-axes.

- 4. Drag-link arm :-**
This arm connects the drag-link to one of the stub-axes. Its function is to provide the leverage to convert the linear drag-link movement to an angular movement about the stub-axle king pin.

- 5. Drag-link suspension and steering interaction:-**
When the axle-beam moves up and down. It does so in a circular arc pivoting about the fixed front shackle-pins. Similarly the drag-link will pivot about the drop-arm ball-joint during any axle vertical movement.

- 6. Stub-axes :-**
Each steered road-wheel is mounted on a short axle-shaft commonly known as a stub-axle. The stub-axle has two extended horizontal prongs which fit over the ends of the axle-beam.

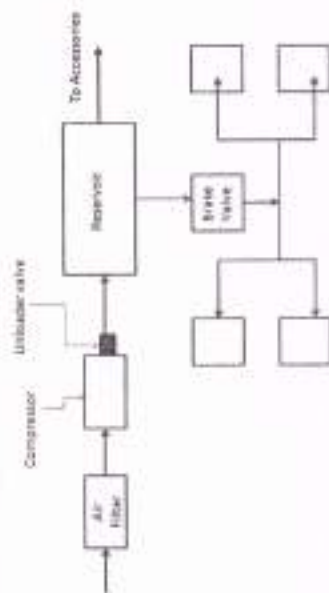

- 7. Track-rod arms:-**
Each stub-axle has a forged track-rod arm rigidly bolted approximately at right angles to the wheel axis in the horizontal plane. The length of this arm provides the leverage to rotate the stub-axle about the king-pin, the rotary movement being transferred to the other stub-axle by means of the track-rod.

- 8. Track-rod:-**
To enable the two stub-axes to pivot together, a tubular rod spins the wheel track. The ends of this rod are fitted with ball-joints which are then bolted to the track-rod arms. When the drag-link moves, it rotates one

ction of braking system

ervice brakes (the ones used while driving for slowing or stopping) to be applied, the brake pedal routing the air under pressure (approx 100–120 psi or 690–830 kPa) to the brake chamber, he brake to be engaged. The air compressor draws filtered air from the atmosphere and forces it -pressure reservoirs at around 120 psi (830 kPa).

essed air brake system is divided into a supply system and a control system. The supply system es, stores and supplies high-pressure air to the control system as well as to additional air auxiliary truck systems (gearbox shift control, clutch pedal air assistance servo, etc.).

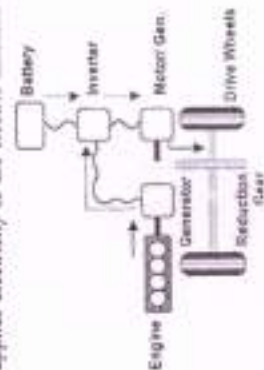

Layout of Air Brake System

ssed air is first routed through a cooling coil and into an air dryer which removes moisture and rities and also may include a pressure regulator, safety valve and smaller purge reservoir. As an ve to the air dryer, the supply system can be equipped with an anti-freeze device and oil r. The compressed air is then stored in a reservoir (also called a wet tank) from which it is then ed via a four way protection valve into the front and rear brake circuit air reservoir, a parking reservoir and an auxiliary air supply distribution point. The system also includes check, pressure limiting, drain and safety valves. Air brake systems may include a wig ice which deploys to warn the driver if the system air pressure drops too low.

Describe the construction and working of hybrid vehicle with neat sketch? (13)

onfiguration

ies HEV, an electric machine, coupled to an ICE, supplies electricity to the electric machine to he vehicle, and to the energy storage system needs to be recharged. As a consequence, the can run at its optimum greatly reducing fuel ption. However, as the electric machine is the one connected to the wheels and the

engine-generator set is sized for sustained grade ability; this configuration requires a large energy storage system pack, electric machine and engine, adding inefficiencies and weight.

Parallel Configuration

Parallel hybrids have mechanical connections to the wheels from both the electric machine and the engine. Therefore, it is possible to downsize both the engine and the electric machine compared to series hybrids. Since the ICE speed is linked to the vehicle speed, the ICE can operate close to its best efficiency curve only under certain conditions. However, since both mechanical and electrical energies can be used to directly propel the vehicle, the powertrain efficiency is increased compared to series configuration during most operating conditions.

11.b) Develop and explain the engine modifications to be undertaken in the S.I engine for Alcohols or Ethanol as alternative fuel? (13)

MAIN JET CHANGES: The main metering jet in your carburetor is the first we will tackle. In most all carburetors this will be a threaded brass plug with a hole drilled through the center of it. This hole is called the main jet orifice! This holes diameter directly affects how rich or lean the air/fuel mixture will be when the engine is running at normal speeds. Smaller the hole less fuel/leaner... bigger hole more fuel/richer. Since alcohol requires a richer air to fuel ratio, it's necessary to bore out the main jet orifice when using ethanol fuel. The increase will be on the order of 20 to 40 percent.

IDLE ORIFICE CHANGES: When idling the idle orifice is the only route of fuel to the engine and therefore the fuel flow will need to be increased at idle as well. Many carbureted engines it is a simple matter to adjust a screw with a flathead screw drive to adjust the amount of fuel allowed through at idle

POWER VALVE CHANGES

A power valve that allows fuel to blend with the air when the engine is revved. This vacuum controlled valve is spring loaded, and shuts off when it isn't needed in order to conserve fuel. For most conversions changing fuel flow is important only from an efficiency stand point.

ACCELERATOR PUMP CHANGES

This is a mechanically activated plunger or diaphragm that injects a stream of gas directly into the throat of the carburetor when the accelerator is suddenly depressed. The fuel is injected through a small orifice located in the throat wall before carburetors throat narrows.

COMPRESSION RATIO CHANGES

Increasing the compression ratio will not be covered here. The ratio can be increased to 14 or 15 to 1. Gas is usually at about roughly 8 to one. It isn't imperative to go all the way to 14 or 15 any increase will give you some of the benefit.

NAMAKKAL DL, TAMIL NADU

PART-C

(i) What are the merits and demerits of LPG as a motor vehicle fuel? (8)

Due to higher octane rating, the combustion of LPG is smoother and knocking is eliminated and the engine runs smoothly.
 When LPG leaks past the rings into the crankcase, it does not wash oil from cylinder walls and does not generate black carbon. Hence, the lubricating layer is not washed away. Thereby, the engine life is increased by 50%.
 Due to the absence of carbon deposits on the electrodes of the spark plugs, the life of the spark plugs is increased.

Advantages:

LPG reduces the volumetric efficiency due to its high heat of vaporization.
 Handling has to be done under pressure of about 18 bars.
 Its characteristics odor is faint, so leakage cannot be easily detected.

(ii) Write the advantages of LNG? (7)

It makes it possible to use natural gas in areas where natural gas is not available via the national gas network or municipal distribution system.
 It is a more economic source of energy when compared to black products (fuel oil and diesel) and

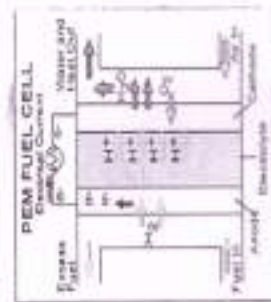

because of its high energy content, the total amount of energy needed is reduced.

(iii) Explain the construction and working of the PEM fuel cell with sketch. (8)

Proton exchange membrane (PEM) fuel cell has shown in below figure uses a solid polymer electrolyte (perfluorosulphonic acid membrane) in the form of a thin, permeable sheet for the transport of protons. Anode and cathode catalyst used generally is platinum, Pt-black or Pt/Ru catalyst.

Operating principle of a PEMFC is relatively simple: it involves the feeding of hydrogen into the cell to be oxidised at the anode, while the oxygen is reduced at the cathode after being carried in by an air feed. The hydrogen is supplied to this porous anode, while the oxygen is supplied to the cathode, mainly by feeding air into the cathode. The input fuel of hydrogen passes over a negatively charged anode, where it is split into H⁺ ions and e⁻ electrons. The electrons are then transported through an external circuit to produce electric current, while oxygen passes over a positively charged cathode.

The ions go through the electrolyte to the positively charged cathode and react with one another to produce H₂O (water) and heat as products.

Furthermore, the straight transformation of the chemical energy of covalent bonds into electricity occurs as a result of the split of the hydrogen and oxygen by the electrolyte also referred to as a separator.

12. (b) (ii) Explain any one method of hydrogen production. (7)

Hydrogen from Nuclear Reactors

The fundamental concept behind nuclear-hydrogen system is to use the heat of the reactors to generate hydrogen via thermochemical or electrochemical processes. In other words, a hydrogen production plant is combined with an advanced nuclear power plant, which serves as a heat source in driving the chemical reactions. Fig. illustrates the flow from nuclear reactor to hydrogen production via a thermochemical process to power generation.

Fig : Nuclear reactor system, involving thermochemical process as the hydrogen production method.

In general, the thermal energy generated by the nuclear reactors serves as a primary heat source to produce hydrogen through thermochemical processes. For direct electrolysis of water, a minimum temperature of 2500°C is required for hydrogen production. Through thermochemical processes like the water-splitting cycle which involves a series of chemical reactions, a lower temperature is required to accomplish the same overall results. The overall performance of the nuclear-hydrogen system will depend on the operating conditions, coolant choice, conversion efficiency, and reactor type as these variables will affect the economical and technological feasibility.

INTERNAL ASSESSMENT TEST-1
EE6503 Power Electronics – Answer Key**

1. Define latching & Holding current of SCR?

Latching current: is defined as the minimum value of anode current required to **TURN ON** the SCR when gate signal is removed.

Holding current is defined as the minimum value of anode current below which it must **turn- off** the SCR.

2. What is commutation? What are the types of commutation?

The turn off process of thyristor is called commutation.

Line Commutation: The circuit is commutated by nature of the AC supply is called natural or line commutation.

Forced commutation: The circuit is commutated by external commutating elements like inductor and capacitor is called forced commutation.

3. What is the function of snubber circuit?

A snubber circuit consists of a series combination of resistance R_s and C_s in parallel with the thyristors. It is mainly used for dv/dt protection.

4. Why IGBT's are popular now days?

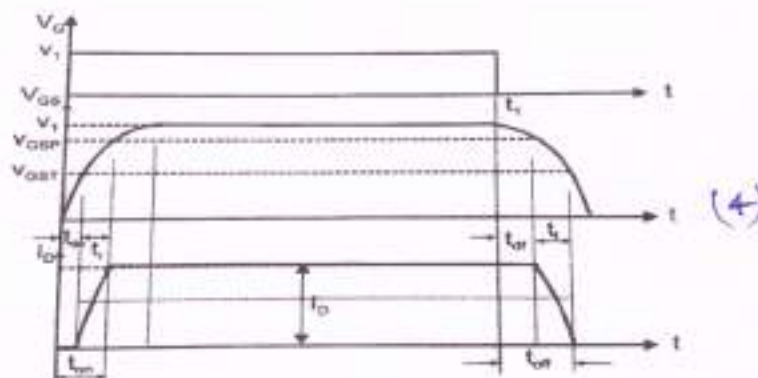

- Lower gate drive requirements
- Lower switching losses
- Smaller snubber circuit requirements

5. Why power factor of semi converter better than that of full converters?

The semi converter receives less reactive power due to freewheeling action when compared with full converter. Therefore, the power factor is better than semi converter.

6.a) Discuss explain the transfer, output and switching characteristics of power MOSFET

SWITCHING CHARACTERISTICS

✓ **TURN ON PROCESS:**

- The **turn on time** is defined as the sum of turn – on delay time and rise time of the device.
- **Delay time t_{de}** during this period, input capacitance charges to gate threshold voltage V_{GS} and drain current is zero.
- **Rise time t_r** during this period, gate voltage rises to V_{GS} . It is the gate source peak voltage.

Total turn on time $t_{on} = t_{ds} + t_r$

PRINCIPAL,
K S R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. R. KALVINAGAR.

- The turn ON time can be reduced by using low impedance gate drive circuit.

✓ **TURN OFF PROCESS:**

- Turn off process is initiated by the removal of V_{GS} at time t_1 , because MOSFET is a majority carrier device.
- The **turn off time** is defined as the sum of turn – off delay time t_{off} and fall time t_f of the device.
- **Delay time t_{off} :** the input capacitance discharges from over drive gate voltage but the drain current does not change.
- **Fall time t_f :** the input capacitance again discharges from V_{GS} to threshold voltage V_{GS1} . Then drain current fall from I_D to zero

Total turn off time $t_{off} = t_{off} + t_f$

6 b) Describe basic structure of IGBT and explain its working. Give its equivalent circuit and explain turn ON and turn OFF characteristics

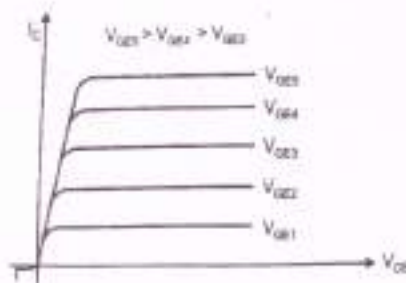

INSULATED GATE BIPOLAR TRANSISTOR (IGBT)

(1)

- IGBT is a new development in the area of power MOSFET technology.
- This device combines the advantages of both MOSFET and BJT.
- It has three terminals namely Collector (C), Emitter (E) and Gate (G)

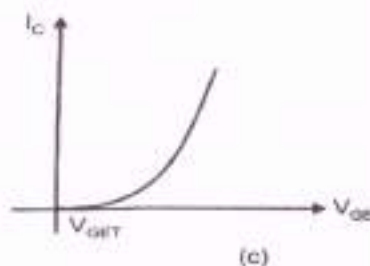

V-I CHARACTERISTICS

(2)

- It is a plot of collector current I_c versus collector-emitter voltage V_{CE} for various values of gate-emitter voltages.
- In the forward direction, the shape of the output characteristics is similar to that of BJT.

✓ **TRANSFER CHARACTERISTICS**

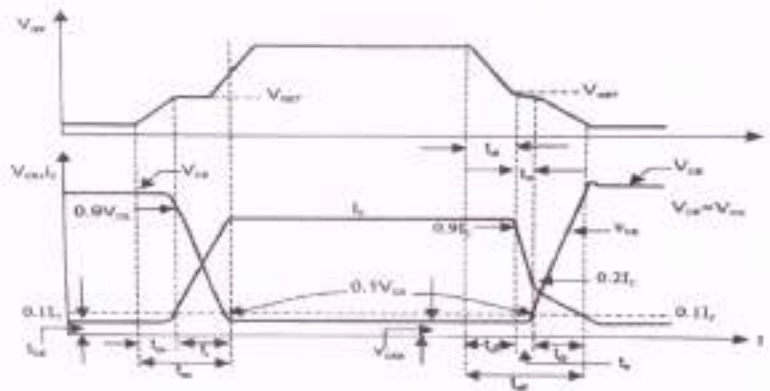

(2)

PRINCIPAL,
K. S. R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. R. KALVIN NIGAR,
TIRUCHENGODE-637 215.

- It is the plot of collector current I_C versus gate-emitter voltage V_{GE} .
- When gate-emitter voltage V_{GE} is less than threshold voltage V_{GET} , IGBT is in OFF state.

SWITCHING CHARACTERISTICS

(8)

TURN ON TIME: the time between the instants of forward blocking to forward ON state.

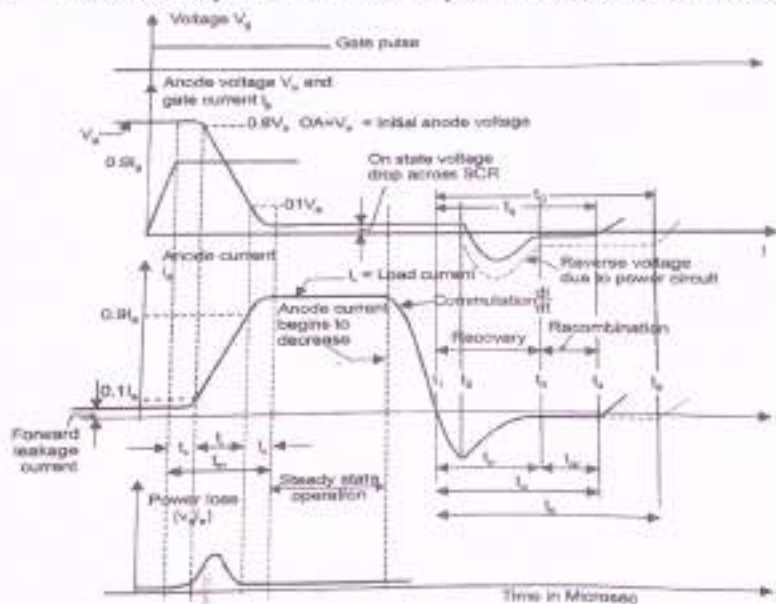

- Turn on time is composed of delay time t_{db} and rise time t_r
- **Delay time t_{db} :** time for the collector emitter voltage falls from V_{CE} to $0.9 V_{CE}$ also defined as the time for the I_C rise from its leakage current I_{CE} to $0.1 I_C$

Rise time t_r : during which collector emitter voltage falls from $0.9 V_{CE}$ to $0.1 V_{CE}$ also defined as I_C rises from $0.1 I_C$ to its final I_C

$$\text{Total Turn on time } t_{on} = t_{db} + t_r$$

- ✓ **TURN OFF TIME:** consists of three interval i) delay time ii) initial fall time t_{f1} iii) final fall time t_{f2} .
- **Delay time t_{df} :** time during which gate voltage falls from V_{GE} to V_{GET} , the I_C falls from I_C to $0.9 I_C$
- **First fall time t_{f1} :** time during which I_C falls from 90 to 20 % of its initial value I_C
- **Final Fall time t_{f2} :** time during which I_C falls from 20 to 10 % of its initial value I_C .

7a) With neat sketch explain the static and dynamic characteristics of SCR

(6)

TURN ON PROCESS

PRINCIPAL
K. S. R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. R. KALVINAGAR,

- The forward biased thyristor will turn on by applying gate pulse.
 - The transition time from forward off state to forward on state is called **SCR turn on time**.
 - **Total Turn ON time** can be divided into three intervals i) delay time t_d ii) rise time t_r iii) spread time t_p .
- ✓ **Delay time (t_d):** is measured from the instant at which gate current reaches $0.9 I_g$ to the instant at which anode current reaches $0.1 I_a$. The delay time can be also defined as, the time during which anode current rises from forward leakage current to $0.1 I_a$.
- The delay time can be decreased by applying high gate current and more forward voltage between anode & cathode.
 - The delay time is fraction of microseconds
- ✓ **Rise time (t_r):** is the time taken by the anode current to rise from $0.1 I_a$ to $0.9 I_a$.
- Rise time is inversely proportional to the magnitude of gate current and its build up rate. (A)
 - It can be reduced by applying high and steep current pulses to the gate.
 - During rise time, turn on losses in the thyristor are the highest due to high anode voltage (V_a) and large anode current (I_a).
- ✓ **Spread time (t_p):** is the time taken by the anode current rise from $0.9 I_a$ to I_a .
- During this time, conduction spreads over the entire cross section of the cathode of SCR.
 - Its depends on area of cathode and gate structure of SCR.
- Total turn on time (t_{on}) = Delay time (t_d) + Rise time (t_r) + Spread time (t_p)**
 $t_{on} = t_d + t_r + t_p$
- ✓ **Hard firing or overdriven :** when gate current is several times higher than the minimum current required a thyristor is said to be hard firing.

TURN OFF PROCESS (S)

- The dynamic processes of the SCR from conduction state to forward blocking state is called commutation processes or turn off process.
 - The SCR can be turned off by reducing the anode current below holding current.
 - **Turn off time (t_q):** the time between the instant anode current becomes zero and the instant SCR regains forward blocking capability.
 - Turn off time is divided into two intervals: **Reverse recovery time t_{rr}** & **gate recovery time t_{gr}** .
 - At t_1 anode current becomes zero.
 - At t_2 , about 60% of the stored charges are removed from the outer two layers.
 - At t_3 , when reverse recovery current has fallen to nearly zero values. At the end of reverse recovery period ($t_3 - t_1$), the middle junction j_2 still has trapped charges, therefore, SCR is not able to block the forward voltage at t_3 .
- ✓ **Gate recovery time t_{gr} :** The time for the recombination of charges between t_3 and t_4 is called gate recovery time t_{gr} .
- ✓ **Circuit turn off time t_c :** The turn off time provided to the SCR by the practical circuit is called circuit turn off time
- SCR with slow turn off time (50-100 μ s) are called **converter grade SCRs** and those with fast turn off time (3- 50 μ s) are called **inverter grade SCRs**.

7b) Explain the construction and working principle of TRIAC with different mode of operation.
TRIGGERING MODES OF TRIAC

- There are four possible electrode potential combinations as given below
 1. MT2 positive with respect to MT1, G positive with respect to MT1

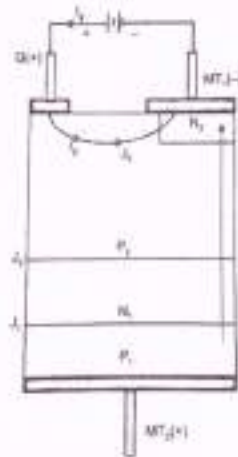

PRINCIPAL.
K. S. R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. R. KA...
TIRUCHENGU - 637 215,
TAMIL NADU.

2. MT2 positive with respect to MT1, G negative with respect to MT1
3. MT2 negative with respect to MT1, G negative with respect to MT1
4. MT2 negative with respect to MT1, G positive with respect to MT1

(1)

- The triggering sensitivity is highest with the combinations 1 and 3 and are generally used.

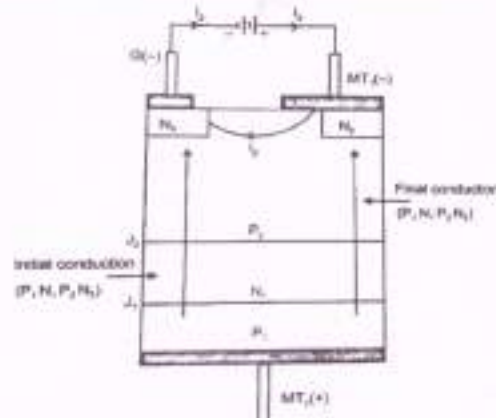

Mode 1: MT2 positive with respect to MT1, G positive with respect to MT1

(2)

- In this trigger mode, the gate current flows mainly through the P_2-N_2 junction like an ordinary thyristor.
- When the gate current has injected sufficient charge into P_2 layer the Triac starts conducting through the $P_1-N_1-P_2-N_2$ layers like an ordinary thyristor.

Mode 2 : MT2 positive with respect to MT1, G negative with respect to MT1

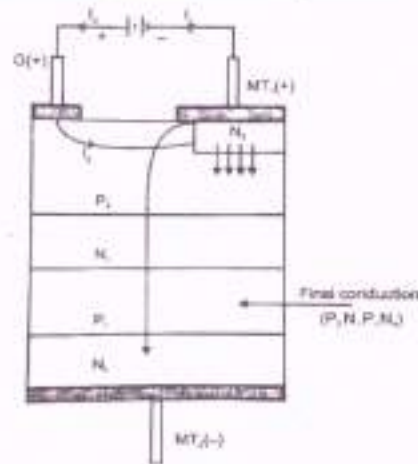

(3)

- The gate current forward biases the gate junction P_2-N_2 .
- Triac starts conducting through $P_2-N_2-P_1-N_1$.
- With the conduction of $P_2-N_2-P_1-N_1$, the voltage drop across it falls but potential of layer P_2-N_2 rises towards the anode potential of MT_2 .

PROFESSOR
M. S. R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. P. ROAD,
TIRUCHENGODE-617 215,
NAMAKKAL Dt. TAMIL NADU.

- A current is thus established in layer P_2 from the left to right which forward biases P_2N_2 junction and finally the main structure $P_1N_1P_2N_2$ begins to conduct.

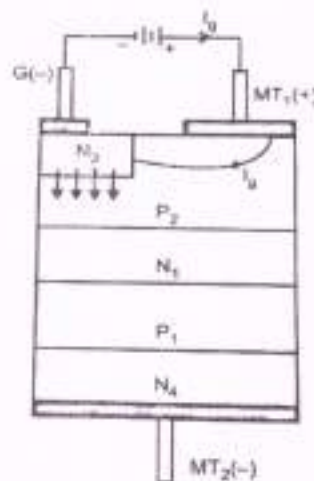

Mode 3 : MT2 negative with respect to MT1, G positive with respect to MT1

(3)

- The external gate current I_g forward biases P_2N_2 junction.
- The structure $P_2N_1P_1N_2$ completely turn on by regenerative process and it conducts the current.

Mode 4: MT2 negative with respect to MT1, G negative with respect to MT1

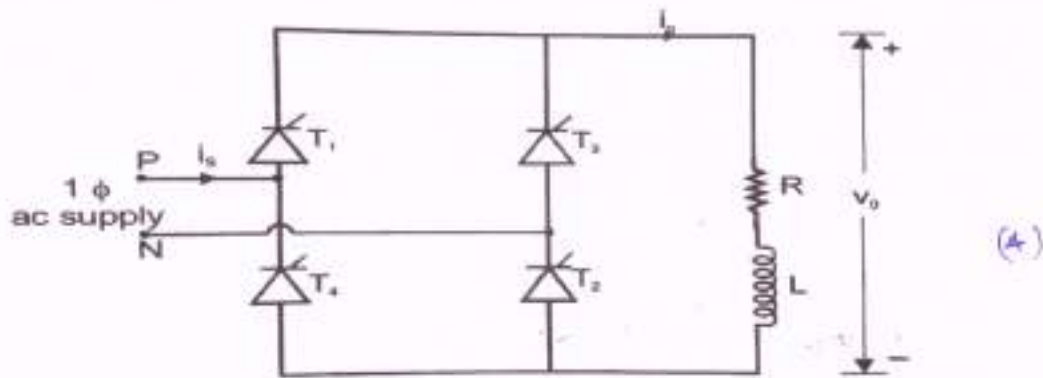

(3)

- In this triggering mode, the gate current I_g forward biases the P_2N_2 junction and a large number of electrons are introduced in the P_2 region by N_2 .
- Finally the structure $P_2N_1P_1N_2$ turns on completely.

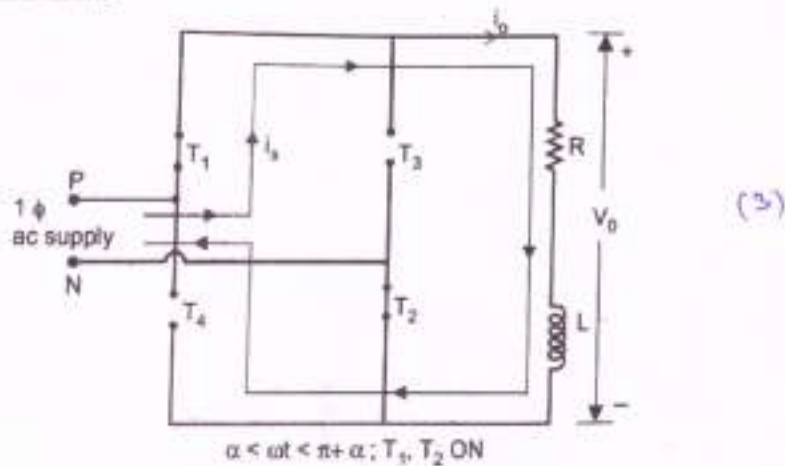

8a) Discuss with the aid of schematic diagram and waveforms, the principle of operation of a two quadrant two pulse converter in the rectifying and inverting mode of operation

PRINCIPAL
K. S. R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. R. KALVI NAGAR,
K. S. R. 637 215.

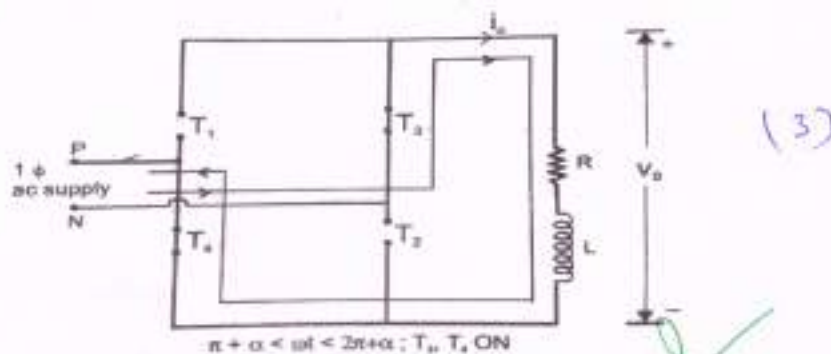

It has two mode of operation

→ Mode I (α to $\pi + \alpha$)

- During the positive half cycle, SCRs T_1 and T_2 are forward biased and if they are triggered simultaneously.
- At $\omega t = \alpha$, SCRs T_1 and T_2 are conducting, then current flows through the path P- T_1 -RL- T_2 -N.
- At $\omega t = \pi$, supply voltage reverses. However, because of very large inductance L , the current is maintained in the same direction at the constant magnitude I , which keeps the thyristor T_1 and T_2 in conducting state and hence, the negative supply voltage appears across the load.

Mode II ($\pi + \alpha$) to $(2\pi + \alpha)$

INTERNAL ASSESSMENT TEST-I Answer Key

Year/Semester	: III/V	Max Marks	: 50
Branch	: Information Technology	Duration	: 1 Hr 30 Min
Subject Code & Title	: CS8591 – Computer Networks	Date & Session	: 15.07.19 & FN

PART-A (4 x 2=8)

1. **What are the three criteria necessary for an effective and efficient network?**

Performance – measured by transit time and response time.

Transit time - time required for a message to travel from one device to another.

Response time is the elapsed time between an inquiry and a response.

Reliability - Frequency of failure, the time it takes a link to recover from a failure.

Security - Protecting data from unauthorized access.

CO1 K1

2. **How does sky propagation differ from line-of-sight propagation?**

Sky propagation

- Higher-frequency radio waves radiate upward into the ionosphere where they are reflected back to earth.
- This type of transmission allows for greater distances with lower output power.

CO1 K2

Line-of-sight propagation

- Very high-frequency signals are transmitted in straight lines directly from antenna to antenna. Antennas must be directional, facing each other and either tall enough or close enough together not to be affected by the curvature of the earth.

3. **For n devices in a network, what is the number of cable links required for a mesh and ring topology?**

Mesh topology – $n(n-1)/2$

Ring topology – $n-1$

CO1 K3

4. **Compare and contrast delay with jitter.**

The latency or delay defines how long it takes for an entire message to completely arrive at the destination from the time the first bit is sent out from the source.

Latency = propagation time + transmission time + queuing time + processing delay

CO1 K3

Jitter is a problem if different packets of data encounter different delays and the application using the data at the receiver site is time-sensitive (audio and video data).

PART-B (3 x 14=42)

With a neat sketch, explain the functions of layers in TCP/IP protocol suite.

File transfer, access & management

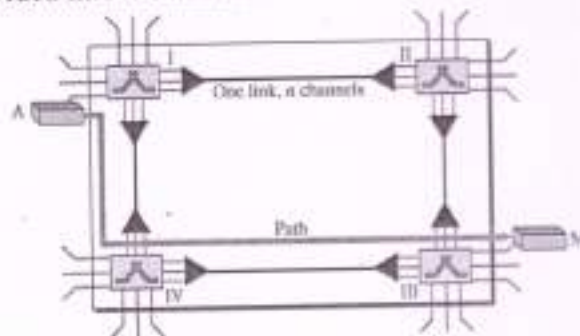

Mail services

Directory services

6. i. For a datagram and packet switched network, a routing table is required to find the output port but a circuit switched network has no need for such a table. Justify your answer. (7)

In circuit switching, a dedicated path is available for data transfer and hence it does not require routing table. (1)

A circuit-switched network is made of a set of switches connected by physical links, in which each link is divided into n channels. (1)

CO1 K3

The actual communication in a circuit-switched network requires three phases:

Setup Phase (1)

Before the two parties can communicate, a dedicated circuit needs to be established.

Data-Transfer Phase (1)

After the establishment of the dedicated circuit, the two parties can transfer data.

Teardown Phase (1)

When one of the parties needs to disconnect, a signal is sent to each switch to release the resources.

Efficiency (1)

Circuit-switched networks are not as efficient as the other two types of networks because resources are allocated during the entire duration of the connection.

Delay (1)

The delay in this type of network is minimal.

- ii. Explain in detail about the types of guided media for transmission. (7)

Guided media provide a medium from one device to another, include (1)

- Twisted-pair cable (2)
- Coaxial cable (2)
- Fiber-optic cable (2)

Twisted-pair cable

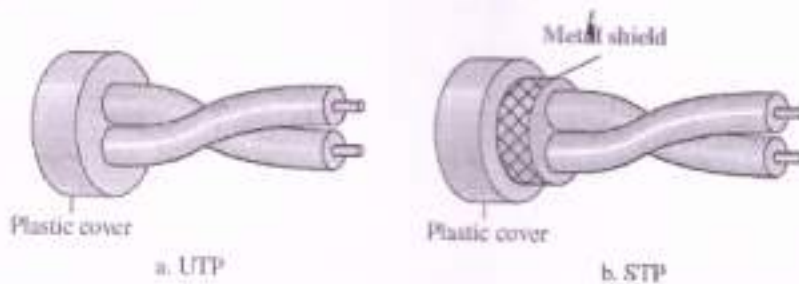

A twisted pair consists of two conductors (normally copper), each with its own plastic insulation, twisted together.

STP cable has a metal foil or braided mesh covering that encases each pair of insulated conductors.

CO1 K

PRINCIPAL,
K. S. R. INSTITUTE FOR
ENGINEERING AND TECHNOLOGY,
K. S. R. KALVI NAGAR,

Categories: 1, 2, 3, 4, 5, 5E, 6, 7 (1 & 2 are used for telephone lines and the remaining are used for LANs).

Connectors: UTP connectors are RJ-45 Female and RJ-45 male.

Applications: Telephone companies

Coaxial cable :

Coaxial cable carries signals of higher frequency ranges than those in twisted pair cable. Coax has a central core conductor of solid or stranded wire enclosed in an insulating sheath, which is, in turn, encased in an outer conductor of metal foil, braid, or a combination of the two.

Category: RG-59, RG-58 and RG-11.

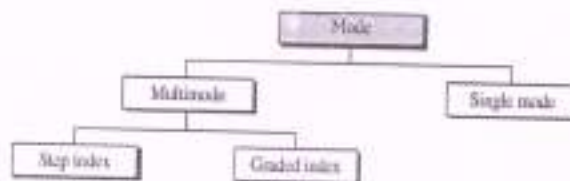

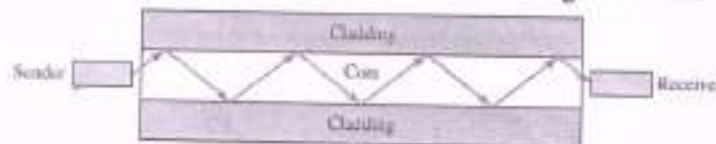

Connectors:

- BNC connector
- BNC T connector
- BNC terminator

Applications: Cable TV networks and Ethernet LANs.

Fiber-Optic Cable

A fiber-optic cable is made of glass or plastic and transmits signals in the form of light.

Applications: Cable TV networks and backbone networks.

7. Suppose you are developing the standard for a new type of packet switched. You need to decide whether the network will use VCs or datagram routing. What are the pros and cons for using VCs?

A virtual-circuit network is a cross between a circuit-switched network and a (4) datagram network. It has some characteristics of both.

1. As in a circuit-switched network, there are setup and teardown phases in addition to the data transfer phase.
2. Resources can be allocated during the setup phase, as in a circuit-switched network, or on demand, as in a datagram network.

CO1 K3

PRINCIPAL,
K. S. R. INSTITUTE FOR

3. As in a datagram network, data are packetized and each packet carries an address in the header.
4. As in a circuit-switched network, all packets follow the same path established during the connection.

Virtual-Circuit Identifier (2)

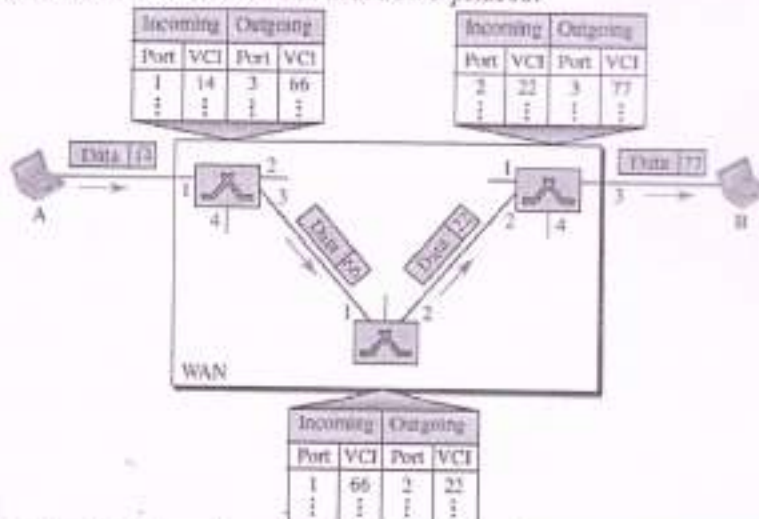

The identifier that is actually used for data transfer is called the *virtual-circuit identifier (VCI)* or the *label*.

Three Phases

A source and destination need to go through three phases in a virtual-circuit network:

- Setup phase (3)
 - Data transfer phase (4)
 - Teardown phase (1)
- In the setup phase, the source and destination use their global addresses to help switches make table entries for the connection.
 - In the teardown phase, the source and destination inform the switches to delete the corresponding entry.
 - Data transfer occurs between these two phases.

In virtual-circuit switching, all packets belonging to the same source and destination travel the same path, but the packets may arrive at the destination with different delays if resource allocation is on demand.
