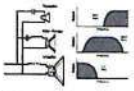
NEWSLETTER AND MAGAZINE

Speakers can be categorized according to the frequency range that they are designed for:

- **Woofers:** speakers designed specifically for low frequencies (less than 200 Hz)
- **Midrange:** speakers designed to accommodate frequencies ranging from 500 Hz to 3000 Hz
- **Tweeter:** a dedicated speaker type specifically designed to handle frequencies above those of midrange speakers
- **Full-range speakers:** capable of handling frequencies ranging from 100 Hz to 15,000 Hz

Such a three-way speaker system is illustrated below.



A typical three-way speaker system consisting of a tweeter, a midrange speaker, and a woofer.

Amplifiers 101

Audio amplifier have three types of classification.

- Preamplifier
- Low-power amplifier
- Power amplifier

An *audio preamplifier* (often shortened to "pre-amp") is an electronic device that amplifies a very weak signal from a microphone, as an example, into signals strong enough to manipulate. Pre-amps are often simple, fixed-gain amplifiers designed specifically for low-noise performance.

A *low-power amplifier* is often used to manipulate signals including such aspects as volume and frequency equalization. This type of amplifier generally focuses on changing the character of the signal in desired ways while introducing as little unwanted distortion as possible and may provide little to no actual power amplification.

An audio *power amplifier* ("power amp") is used to increase the signal power so as to drive a load, such as output speakers. Similar to pre-amps, power amps are often fixed gain (in terms of signal amplitude) so that designers can focus on high-power gain and the power handling challenges that typically result. In simple audio systems where high power and high fidelity are not critical factors, a single-amplifier circuit may perform all of these functions, and, in fact, specially designed operational amplifiers, such as the LM-386 Low Voltage Audio Power Amplifier, are often used this way.

Conclusion

Audio electronics can be summarized as converting sound to electrical signals, processing the electrical signals, and turning these processed signals back into sound. This is a straightforward objective; nevertheless, this particular discipline of electrical engineering covers many areas of the EE world. In fact, many practicing engineers spend their entire careers researching, developing, and designing audio electronics and related equipment

Introduction about the Course

Electrical Drives is a subject which gives the information about different types of drive motors, control techniques and where it will be used. Nowadays industries are increasingly demanding automation process in all sectors. Automation results into better quality, increased production and reduced costs .Depending on the application, some of them are fixed speed and some of them are variable speed. When an electric motor is to be selected as a drive motor, first the speed-torque requirement of the load is determined. The invention of power semiconductors saw the advent of drives systems for most of variable speed requirements. It is seen that due to various advantages, electric motors are used as drive motors in various industrial applications. A.C drives are normally termed as constant speed drives. But with the development of GTO/transistors as high speed power switching devices along with control/ data acquisition circuits based on microprocessors/ Personal Computers, A.C drives are now being used for variable speed applications. Generally synchronous motor is expensive than induction motor drives, but the advantage is that the efficiency is higher, which tends to lower the life cycle cost. In many practical applications, it is necessary to have variable speed drive. In such a case it is necessary to control the speed of D.C motor which is used as a drive. The speed can be controlled by conventional and solid state methods. DC drives are widely used in application requiring adjustable speed, good speed regulation and frequent starting. The transfer function of a DC drive system is discussed and closed loop control of the system is derived for various speed control techniques.

Medical electronics deals with the instrumentation used in physiological measurement. Developments in electronics technology have offered new and enhanced applications, especially in the areas of data recording and analysis and imaging technology. These techniques help to identify the disorders in human body and to treat them on time.

In unit I, Electro-Physiology and Bio-Potential Recording discuss the basic electronic equipments used in medical applications. The origins of bio potential with its electrodes are briefly explained. The types of amplifiers used in biological field helps in processing the real time signals detected from human body. The devices used to measure the electrical signal from various part of the body are explained. The devices such as Electro cardiograph, Electro Encephalography, Electromyography and Phonocardiogram are briefly explained with its working procedures. The operation of these devices helps the students to re model the existing devices and so can be used for advanced measurement of electrical signals. The electrical signal measurement helps in understanding the working condition of various parts of the body. The above mentioned equipments help in measuring the electrical signals from heart, brain, eyes and muscles.

INTRODUCTION:

The term thermodynamics stems from the Greek words. Therme means heat and dynamics m power. Today, conversion of heat energy into power plays important role in power generation, refrigeration One of the important fundamental laws is conservation of energy principle. It states that energy can ch from one form to another form without losses during energy interaction. So, the first law of thermodynami simply an expression of conservation of energy.

In any systems, the rate of flow of working fluid is constant with respect to time, then the sy is known as steady flow system. In this system, the mass of working fluid enters the system and leaves system after doing work. Therefore this system is known as open system. From first law of thermodynamics total energy entering the system is equal to total energy leaving the system. This law is applicable to the st flow systems. The second law of thermodynamics states that the entropy of an isolated system never decre because isolated systems spontaneously evolve towards thermodynamic equilibrium the state of maxir entropy. Equivalently, perpetual motion machines of the second kind are impossible.

A pure substance is a substance of constant chemical composition throughout its mass. It is a o component system. It may exist in one or more phases. Let us take water as the representative of a substance to study the behavior of water in all the three phases in thermodynamic plots on p-v, p-T, T-s and coordinates. A power cycle continuously converts heat into work in which a working fluid repeatedly perfc a succession of processes. The Rankine cycle is a mathematical model that is used to predict the performanc steam engines. The Rankine cycle is an idealized thermodynamic cycle of a heat engine that converts heat nechanical work.

In many important thermodynamics applications it requires homogeneous mixture of several substances rather than a single pure substance. A non reacting gas mixture can be treated as a pure subst since it is usually a homogeneous mixture of different gases. The thermodynamic behavior of a mixture of g depends upon the individual properties of its constituent gases. Therefore, wide variation is possible in properties of gaseous mixtures. Real gases as opposed to a perfect or ideal gas exhibit properties that canno explained entirely using the ideal gas law.

The studies of properties of air-water vapour mixtures. Atmospheric air is considered to be a mixtur dry air and water vapour. The control of moisture content in the atmosphere is essential for the satisfac operation of many processes involving hygroscopic materials like paper and textiles and it important in com air conditioning. A Psychrometric Chart is an important tool for HVAC engineers to carry out heat loa cooling load calculations and find solutions to various air condition related problems.

INTRODUCTION:

Modern world scenario is ever changing. Data Communication and network have changed the way business and other daily affair works. Now, they highly rely on computer networks and internetwork.

A set of devices often mentioned as nodes connected by media link is called a Network. A node can be a device which is capable of sending or receiving data generated by other nodes on the network like a computer, printer etc. These links connecting the devices are called Communication channels.

Computer network is a telecommunication channel using which we can share data with other computers or devices, connected to the same network. It is also called Data Network. The best example of computer network is Internet. Computer network does not mean a system with one Control Unit connected to multiple other systems as its slave. That is Distributed system, not Computer Network

The entire course is divided into five units:

Unit-1:

Gives an overview of network, protocol layering, TCP/IP protocol suite and OSI model. It also covers transmission media and switching in physical layer.

Unit-2:

Deals with data link layer services and protocols. Also includes MAC, Ethernet (802.3), Wireless LANs, Bluetooth and connecting devices.

Unit-3:

Deals with functionalities of network layer, IPV4 addresses, protocols, unicast routing algorithms and protocols, multicasting and IPV6.

Unit-4

Deals with transport layer protocols like TCP and UDP, services and SCTP.

Unit-5

Gives an idea on various application layer protocols to develop applications.

COURSE OBJECTIVES:

- To understand the protocol layering and physical level communication.
- To analyze the performance of a network.
- To understand the various components required to build different networks.
- To learn the functions of network layer and the various routing protocols.
- To familiarize the functions and protocols of the Transport layer.

- Supermarkets, e-tendering documents
- Signing web forms, , filing income tax returns

PREREQUISITE:

- Basics of computer science
- Knowledge about hardware components
- computer configuration

OUTCOMES:

At the end of the course, the student should be able to:

C302.1: Recognize the basic layers and its functions in computer networks and evaluate the performance of a network.
C302.2: Demonstrate the basics of how data flows from one node to another.
C302.3: Analyze and design routing algorithms.
C302.4: Design protocols for various functions in the network.

INTRODUCTION TO OBJECT ORIENTED PROGRAMMING

Programming knowledge is not only useful for programming today's devices such as computers and smart phones, it also opens doors to the valuable skill of computational thinking, i.e. the application of computing techniques to every-day processes.

In this introductory Java programming course, student will be introduced to powerful concepts such as functional abstraction, the object oriented programming (OOP) paradigm and Application Programming Interfaces (APIs). Examples and case studies will be provided so that you can implement simple programs on your own or collaborate with peers. The program will begin with introducing fundamental programming concepts, such as, functional abstraction, OOP paradigm and APIs. Then, we will focus on how to write "good" programs, where "good" is to be understood from several perspectives: correctness, efficiency, software engineering techniques, and ethics.

In this professional programming subject, student will learn how to write code in Java, understand the basics of OOP and how to use software engineering techniques to develop various kinds of applications.

OBJECTIVES:

The student should be made to:

- To understand Object Oriented Programming concepts and basic characteristics of Java.
- To know the principles of packages, inheritance and interfaces.
- To define exceptions and use I/O streams.
- To develop a java application with threads and generics classes.
- To design and build simple Graphical User Interfaces.

PREREQUISITE:

Basic knowledge of,

- Requires basic understanding of C and C++ programming language.
- To had prior exposure to compile and run the program using any kind of editor.
- To have knowledge in operating system and software Engineering concepts.

APPLICATIONS:

- To be able to develop desktop GUI applications and Mobile applications.
- To be able to develop dynamic web applications and web servers.
- To know Java Enterprise Edition (Java EE) is a popular platform that provides API and runtime environment for scripting and running enterprise software, including network applications and web-services.
- To know the java technologies behind embedded system development.
